TDE-Designer » Kubernetes Log Support for TDE

TDE is now enhanced with Kubernetes driver logs that are displayed in the Designer UI based on Kubernetes API call. It also allows to read Kubernetes pod logs and delete the pods, upon deletion of Designer jobs, using namespace and pod name. In addition, the Read HDFS component is enhanced with the Browse option that allows to browse a file or directory and retains the selected file or directory path as the base path.

The topics related to this feature are given below:

Managing Logs

Deleting Jobs

Configuring Read HDFS

DW Export » Support for L3 Java API in DW

Hook fields in DW are now extended to support Java classes that implement the super class of the hook component. Any Java method that implements the super class of the hook component can be attached in the DW hook field if it has an entry in EB.API with the METHOD source type. This enhancement enables the hook fields to support both JBC routines and Java class methods.

The topic related to this feature is given below:

Support for L3 Java API in DW
