Transact Data Hub » Health API

Health API allows to get the status of Kubernetes pods by verifying the API. Its Liveness and Readiness probes help to monitor the status of the containers and recover them in case of any issues.

TDE Admin » External Application Support

Transact Data Hub (TDH) and Temenos Data Lake (TDL) are now enhanced to support data processing from external applications. This provides the ability to add external applications into the TDH/TDL product and stream data into them, to make them available for downstream systems in the TDE platform. The data from the external system is treated similar to Data Event Streaming and is handled by the landing and ODS/SDS process.
