ODS/SDS » Include/Exclude Child Tables for Data Loading

Operational Data Store (ODS) and Snapshot Data Store (SDS) now allow the exclusion of child tables for data loading in the target database. Based on the exclusion configuration, ODS and SDS process do not load the data in child tables that are excluded. This avoids any unnecessary load for ODS and SDS process, increases the performance and optimizes the storage.

> Include/Exclude Child Table in SDS

Reconciliation » Reconciling Record Count and RECIDs between Transact and ODS/SDS

TDE now allows the user to reconcile records between Transact and ODS/ SDS and vice-versa at the count and RECID levels. This helps to ensure that all the records from Transact are processed in ODS/SDS and vice-versa and identify the missed RECIDs. It also provides the feature to exclude tables from reconciliation.
